In this area with my group we have proposed a new theory, called WAT (Words As social Tools). The monograph for Cambridge University Press “<i>The freedom of words: On abstractness and the power of language</i>” (2023) summarizes my research in this area.</p> <p>Lately I have focused also on specific kinds of concepts – I am interested in gender concepts and ecological and technological concepts and how their representation changes depending on the context and across the lifespan.</p> <p>I investigate concepts and language with a lifespan perspective – I have worked on conceptual acquisition and development and on the decline of semantic memory with aging.</p> <p>I conduct mostly behavioral research (response times recording, kinematics, eye tracker) but also TMS and EEG studies; in collaboration with other researchers I have occasionally performed fMRI and thermal imaging studies and have carried out computational studies with neural networks simulations.</p> <p>I am committed to the principles of Open and Reproducible Science, which I pursue both in my own research practices and in my mentoring, encouraging my trainees to adopt practices like preregistration, pre-registered reports, and data and code sharing on open platforms such as Open Science Framework.</p> |
